

# Deploying Microservices

Estimated time: 90 minutes

Welcome to the lab **Deploying Microservices**. You will deploy the **Pictures** and **Songs** services to the cloud in this lab. You should have all the code ready from the previous labs in this capstone. The lab focuses on deploying working code as follows:

- **Pictures** service is deployed to IBM Code Engine.
- **Songs** service is deployed to RedHat OpenShift.

## Learning Objectives:

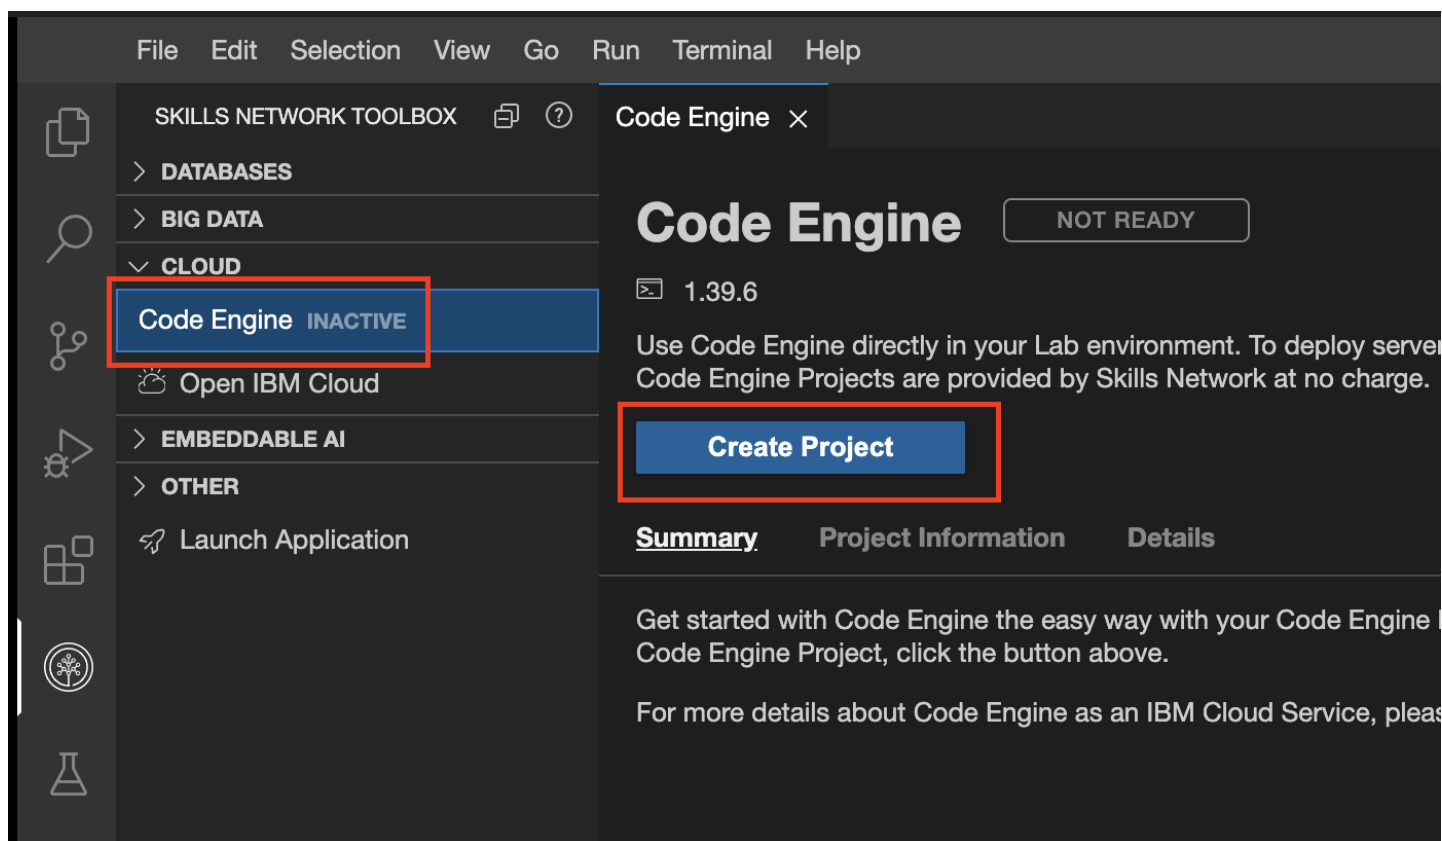

After completing this lab you will be able to:

1. Start Code Engine service in the lab environment.
2. Deploy a Flask service to Code Engine.
3. Access the RedHat OpenShift platform in the lab environment.
4. Deploy a Flask service to RedHat OpenShift.

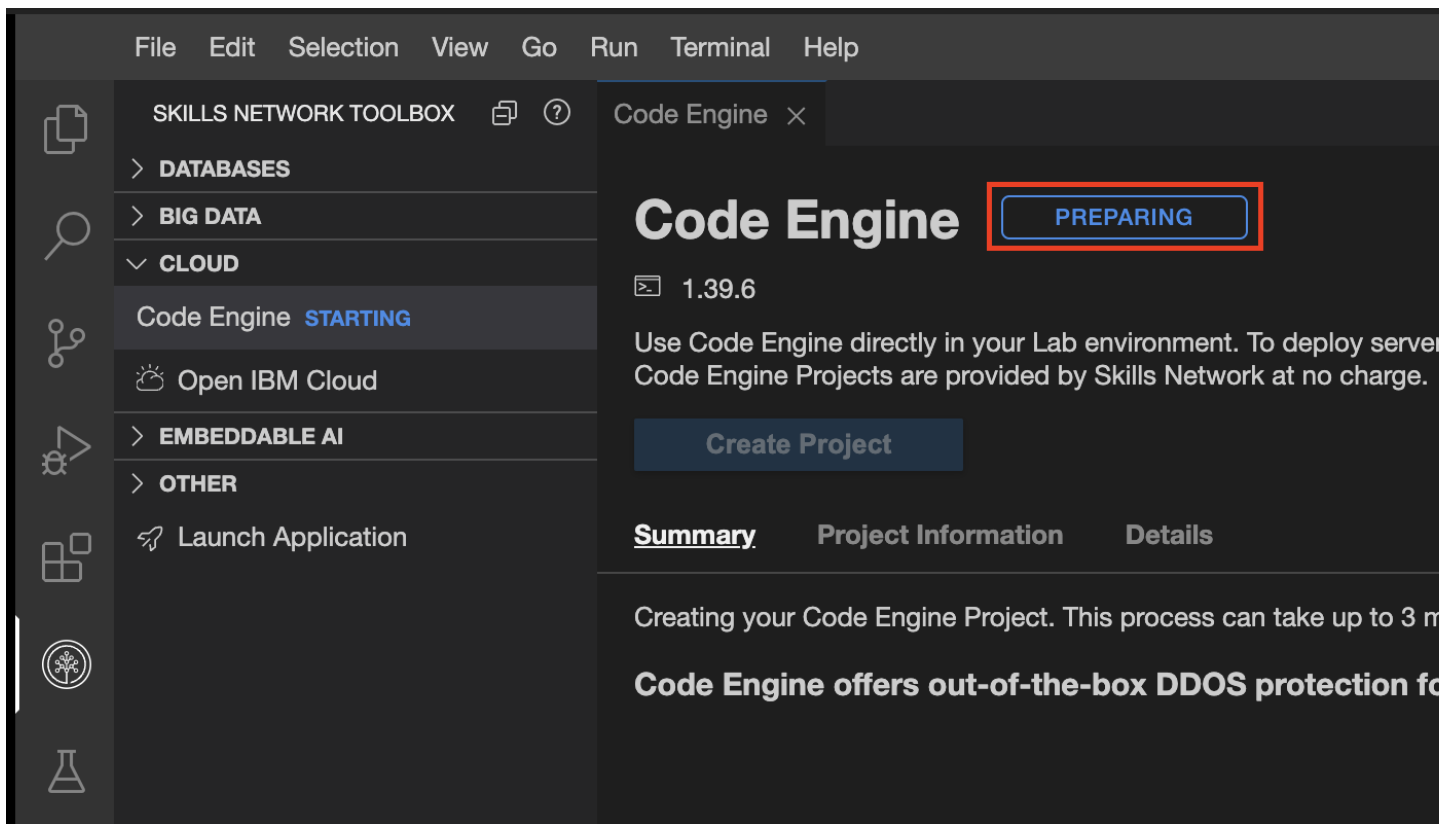

## Exercise 1: Pictures - Start Code Engine

### Your Tasks

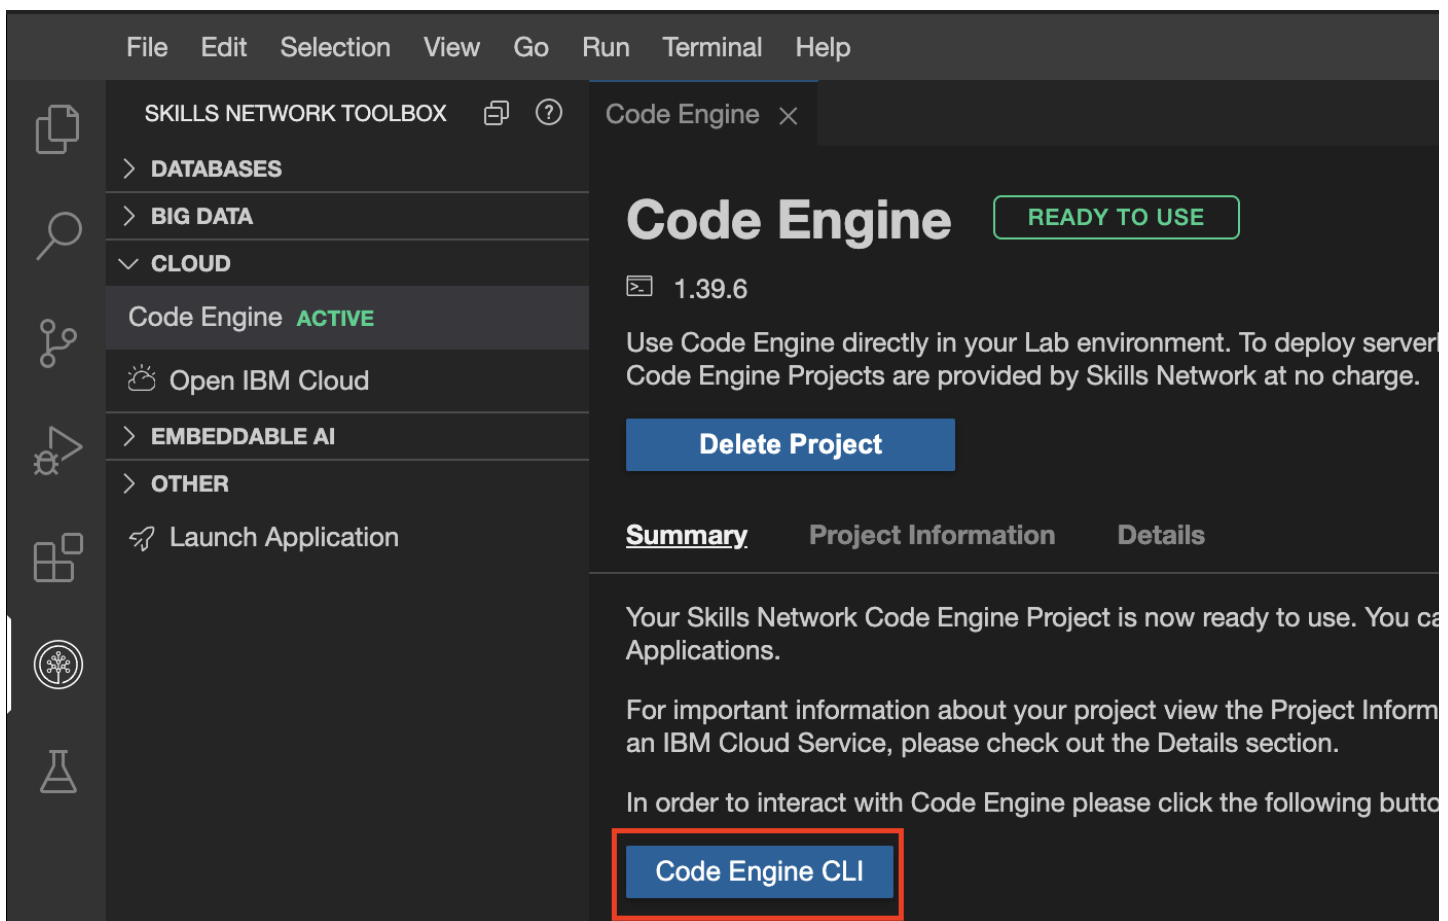

1. On the menu in your lab environment, click the C1oud dropdown menu and select Code Engine. The code engine setup panel appears. Click Create Project to begin.

2. The code engine environment takes a while to prepare. You will see the progress status is indicated in the setup panel.

3. Once the code engine set up is complete, you can see that it is active. Click Code Engine CLI to begin the pre-configured CLI in the terminal as shown below.

Take a screenshot of the terminal and save it as `deploy-getpic-1.jpg`.

4. You will observe that the pre-configured CLI startup and the home directory are set to the current directory. As a part of the pre-configuration, the project has been set up, and Kubeconfig is set up. The details are shown on the terminal as follows.

The screenshot shows the Skills Network Toolbox interface. On the left is a sidebar with icons for various tools. The main area displays the 'Code Engine' project status as 'READY TO USE' with version '1.39.6'. It includes a 'Delete Project' button and tabs for 'Summary', 'Project Information', and 'Details'. The 'Summary' tab is active, showing that the project is ready for use. Below this, there is a 'Code Engine CLI' button highlighted with a red box. At the bottom, a terminal window shows the command 'ibmcloud ce project current' and its output, which includes project details like Name, ID, Subdomain, Domain, Region, and Kubernetes Config. The terminal output is also highlighted with a red box.

**Code Engine** **READY TO USE**

1.39.6

Use Code Engine directly in your Lab environment. To deploy serverless Code Engine Projects are provided by Skills Network at no charge.

**Delete Project**

**Summary** Project Information Details

Your Skills Network Code Engine Project is now ready to use. You can now deploy Applications.

For important information about your project view the Project Information or, if you are using an IBM Cloud Service, please check out the Details section.

In order to interact with Code Engine please click the following button:

**Code Engine CLI**

Problems theia@theiadosker-captainfedo1: /home/project

```
ibmcloud ce project current
theia@theiadosker-captainfedo1:/home/project$ ibmcloud ce project current
Getting the current project context...
OK

Name:      Code Engine - sn-labs-captainfedo1
ID:        9c079722-5f80-4056-bed6-798cdb0acf04
Subdomain: ywj8nhvp9f9
Domain:    us-south.codeengine.appdomain.cloud
Region:    us-south

Kubernetes Config:
Context:    ywj8nhvp9f9
Environment Variable: export KUBECONFIG="/home/theia/n-labs-captainfedo1-9c079722-5f80-4056-bed6-798cdb0acf04"
theia@theiadosker-captainfedo1:/home/project$
```

## Evidence

1. Take a screenshot of the terminal showing the output of the `ibmcloud ce project current` command.
2. Save the screenshot as `deploy-getpic-1.jpg` (or `.png`).

## Exercise 2: Pictures - Clone GitHub Repository

The next step is to clone the **Pictures** microservice repository to the local lab environment.

### Your Tasks

You created a new repository for the pictures service from the provided template in a previous lab. If not, go back to the Create Get Pictures Service with Flask lab and ensure you complete it before coming back to this lab.

1. Open a terminal with Terminal -> New Terminal if one is not open already.
2. Next, use the `export GITHUB_ACCOUNT` command to export an environment variable that contains the name of your GitHub account.

**Note:** Substitute your real GitHub account for the `{your_github_account}` placeholder below:

- ```
1. 1
1. export GITHUB_ACCOUNT={your_github_account}
```

Copied! Executed!

3. Then use the following commands to clone your repository.

```
1. 1
1. git clone https://github.com/$GITHUB_ACCOUNT/Back-End-Development-Pictures.git
```

Copied! Executed!

4. Click the button below and see if the routes.py contains all the changes you have done and pushed in the previous lab. If you don't see the changes, you have to repeat the [previous lab](#) and rebuild you deployment on the Openshift container.

Open routes.py in IDE

# Exercise 3: Pictures - Run Application locally

## Your Tasks

Now that you have all the code in the local lab environment, let's run the applicaiton locally to ensure it works as expected. You should have finished implementing the microservice in a previous lab.

### Task 1: Run the application locally

1. Change to your project directory as follows.

```
1. 1
1. cd Back-End-Development-Pictures
```

Copied! Executed!

2. Run locally to test once by running the following command.

```
1. 1
1. flask run --debugger --reload
```

Copied! Executed!

3. Open another new terminal and run the following command to check the application health.

```
1. 1
1. curl localhost:5000/health
```

Copied! Executed!

If the application does not run locally, you should return to module 1 and ensure you have finished the Create Get Pictures Service with Flask lab. Once you are done testing locally, you can exit the server by using the keys ctrl+c on the keyboard. You can exit the terminal by using the exit command.

# Exercise 4: Pictures - Deploy to Code Engine

Once you have ensured that the application is running as expected, the next thing is to deploy the application on Code Engine. This will require the Dockerfile, which has been provided already. You will first build an image of the application and push it to the lab image registry provided under your account.

## Your Tasks

1. The lab environment comes with an IBM Container Registry. You can push images to only one namespace `SN_ICR_NAMESPACE`. Use the terminal to find what this namespace is for your lab environment:

```
1. 1
1. echo ${SN_ICR_NAMESPACE}
```

Copied! Executed!

You should see an output similar to this:

```
1. 1
2. 2
3. 3
1. theia@theiaopenshift-captainfedo1:/home/project$ echo ${SN_ICR_NAMESPACE}
2.
3. sn-labs-captainfedo1
```

Copied!

2. Build the image with the following command:

```
1. 1
1. docker build -t pictures .
```

Copied! Executed!

3. Tag the image as us.icr.io/\$SN\_ICR\_NAMESPACE/pictures:1.

```
1. 1
1. docker tag pictures us.icr.io/$SN_ICR_NAMESPACE/pictures:1
```

Copied! Executed!

4. You can see both the original and the tagged images by using:

```
1. 1
1. docker images
```

Copied! Executed!

Your output should have the two images with any additional images already provided by the lab environment. You should also see the base python:3.9.16-slim image that was used in the Dockerfile:

```
1. 1
2. 2
3. 3
4. 4
5. 5
1. $ docker images
2. REPOSITORY
3. pictures
4. us.icr.io/sn-labs-captainfedo1/pictures
5. python
TAG
latest
3.9.16-slim
IMAGE ID
7c230d5bcdbf
7c230d5bcdbf
cdd46c8d76cc
CREATED
2 minutes ago
2 minutes ago
19 hours ago
SIZE
179MB
179MB
124MB
```

Copied!

Not that the original image and the tagged images have the same IMAGE ID indicating the difference is in tags only.

5. Push the image to the registry using the following command:

```
1. 1
1. docker push us.icr.io/$SN_ICR_NAMESPACE/pictures:1
```

Copied! Executed!

6. You can use the following command to list all images in your namespace.

```
1. 1
1. ibmcloud cr images --restrict $SN_ICR_NAMESPACE
```

Copied! Executed!

You should see the image you just pushed:

```
1. 1
2. 2
3. 3
4. 4
5. 5
6. 6
7. 7
1. $ ibmcloud cr images --restrict $SN_ICR_NAMESPACE
2. Listing images...
3.
4. Repository          Tag      Digest      Namespace      Created      Size      Security status
5. us.icr.io/sn-labs-captainedf01/pictures  1        f3c8e1ef47f4  sn-labs-captainedf01  7 minutes ago  68 MB      -
6.
7. OK
```

Copied!

7. Use the following command to deploy the application on Code Engine:

```
1. 1
1. ibmcloud ce app create --name pictures --image us.icr.io/${SN_ICR_NAMESPACE}/pictures:1 --registry-secret icr-secret --port 3000
```

Copied! Executed!

You will see that the command creates the application and also internally sets up the required infrastructure. It takes a few minutes and it finally gives a confirmation along with the URL. Your URL will look different:

```
1. 1
2. 2
3. 3
4. 4
5. 5
6. 6
7. 7
8. 8
9. 9
10. 10
1. $ ibmcloud ce app create --name pictures --image us.icr.io/${SN_ICR_NAMESPACE}/pictures:1 --registry-secret icr-secret --port 3000
2. Creating application 'pictures'...
3. The Route is still working to reflect the latest desired specification.
4. Configuration 'pictures' is waiting for a Revision to become ready.
5. Ingress has not yet been reconciled.
6. Waiting for load balancer to be ready.
7. Run 'ibmcloud ce application get -n pictures' to check the application status.
8. OK
9.
10. https://pictures.zcx38jqwqmu.us-south.codeengine.appdomain.cloud
```

Copied!

Take a screenshow of the terminal showing the output of the `ibm ce app create --` command and save it is `deploy-getpic-2.png` (or `jpg`).

8. Copy the application URL, paste it in a new tab, and press **Enter**. You will need to add a valid path to see a result. You can test `URL/count` or `URL/health` to test the microservice. Take a screenshot of the browser tab showing the `/count` endpoint and save it as `deploy-getpic-3.png` (or `jpg`).

9. If you lose the application URL, you can look it up by using the command:

```
1. 1
1. ibmcloud ce application list
```

Copied! Executed!

```
1. 1
2. 2
3. 3
4. 4
5. 5
6. 6
1. $ ibmcloud ce application list
2. Listing all applications...
3. OK
4.
5. Name      Status  URL
6. pictures  Ready   https://pictures.zcx38jqwqmu.us-south.codeengine.appdomain.cloud
```

Copied!

|                | Latest | Age   | Conditions | Reason |
|----------------|--------|-------|------------|--------|
| pictures-00001 |        | 4m55s | 3 OK / 3   |        |

Evidence

- 1. Take a screenshot of the terminal showing the output of the `ibmcloud ce create ...` command with the final URL for the application and save it as `deploy-getpic-2.png` (or `jpg`).
- 2. Take a screenshot of the running application in your browser with the `/count` endpoint. Save the screenshot as `deploy-getpic-3.png` (or `jpg`).
- 3. Save the URL of the pictures service. You will use it in the next lab to connect the main Django application with the microservice.

Exercise 5: Pictures - Confirm Code Engine Application

Congratulations on running your application on Code Engine. This final step will verify the application using the terminal.

Your Tasks

1. To get the details of the application, run the following command:

```
1. 1
1. ibmcloud ce app get --name pictures
```

Copied! Executed!

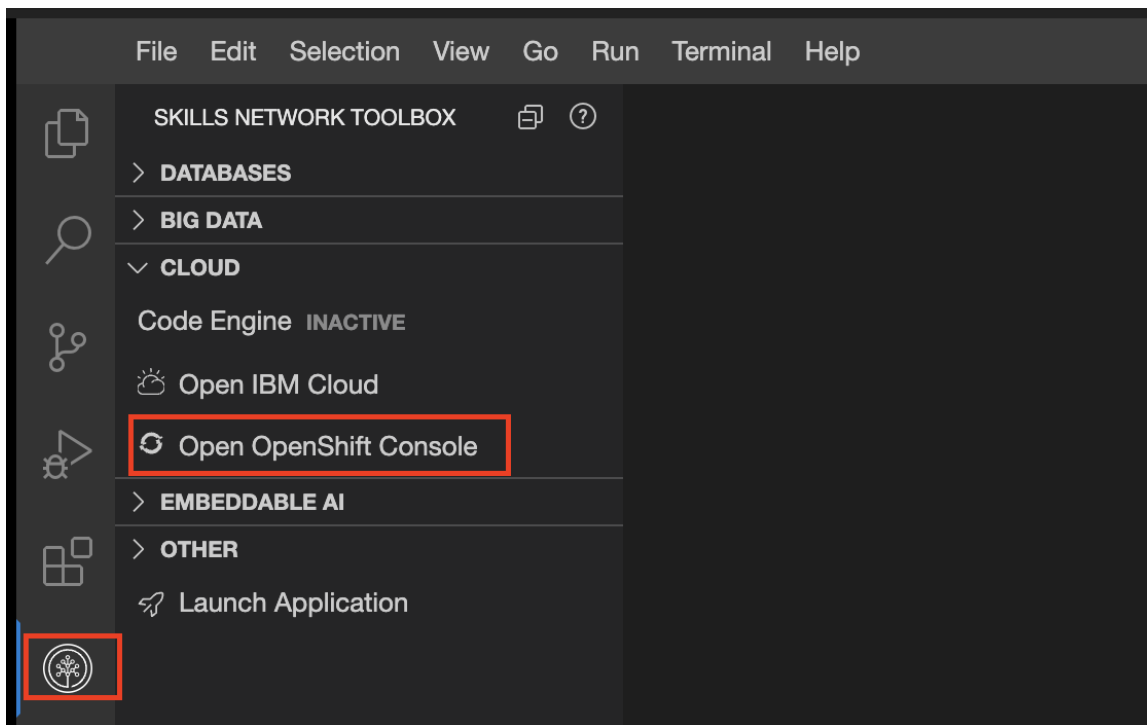

You should see detailed information about the application, including the time of creation, resources used, number of instances, and other details.

Exercise 6: Songs - Install MongoDB on OpenShift

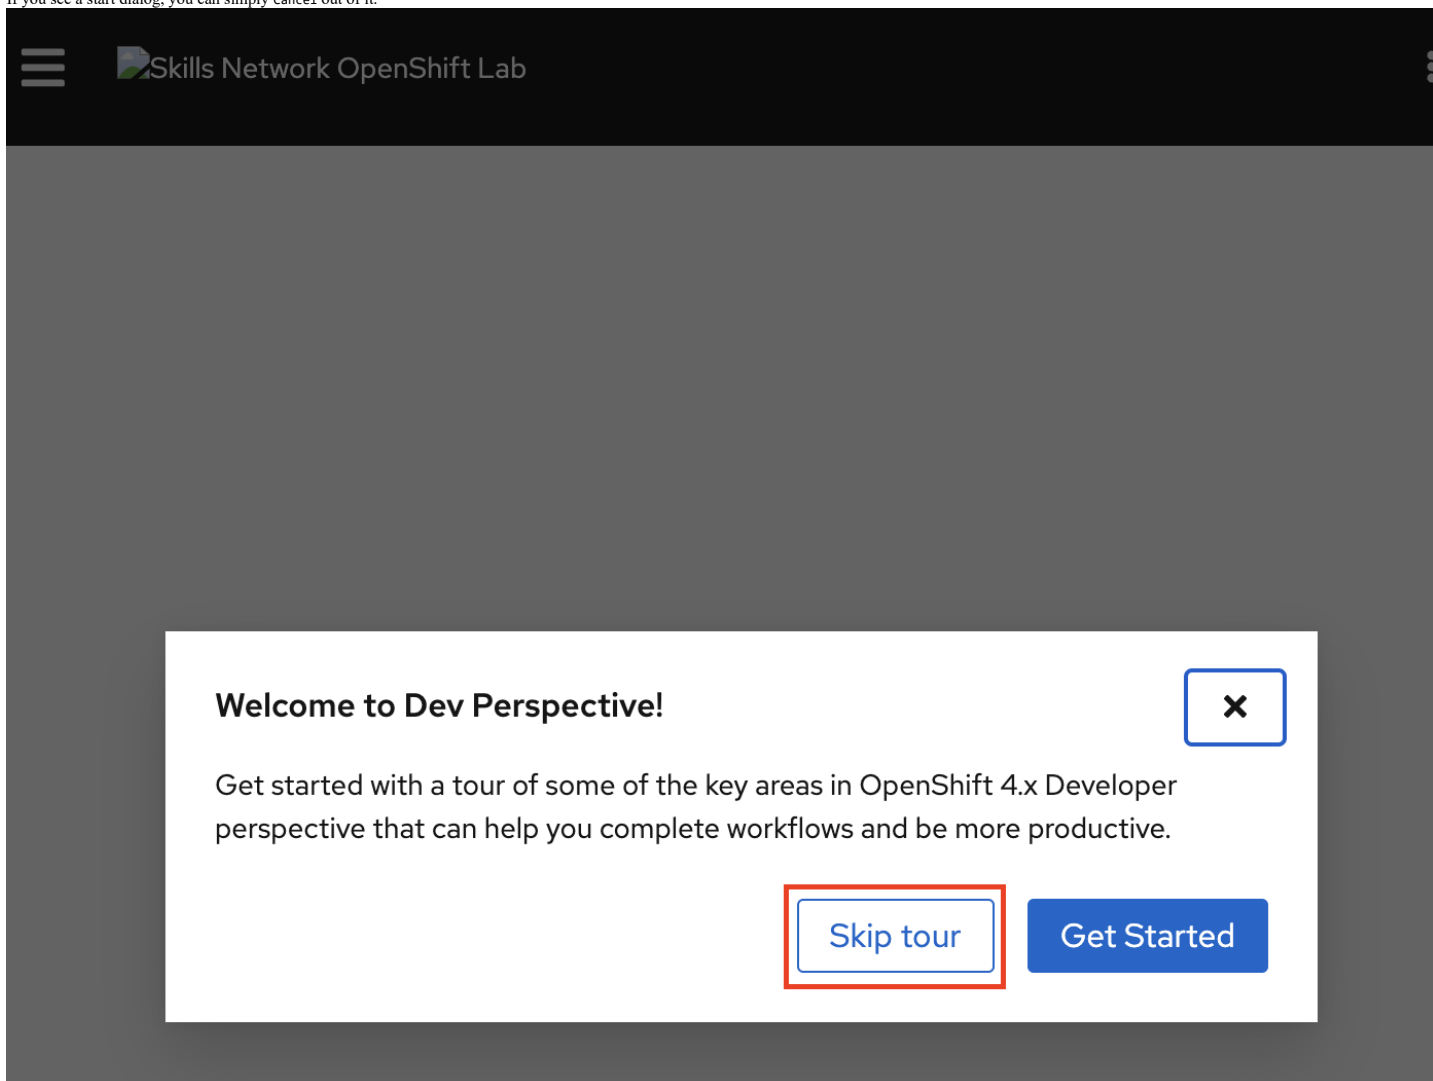

You used the MongoDB server provided in the lab environment for the exercises in the previous modules. This server is limited to the lab environment only and cannot be reached from another platform like RedHat OpenShift. In order to successfully use MongoDB as the database server in production, you will install it in RedHat OpenShift in this exercise.

Your Tasks

- 1. Launch the OpenShift console from the lab environment. This will open a new tab.

If you see a start dialog, you can simply cancel out of it.

2. Click Topology. You should see only one application in your project.

Skills Network OpenShift Lab

Project: sn-labs-captainfedo1

Application: all applications

Display Options

Filter by Resource

Find by name...

Developer

+Add

Topology

Monitoring

Search

Builds

Pipelines

Helm

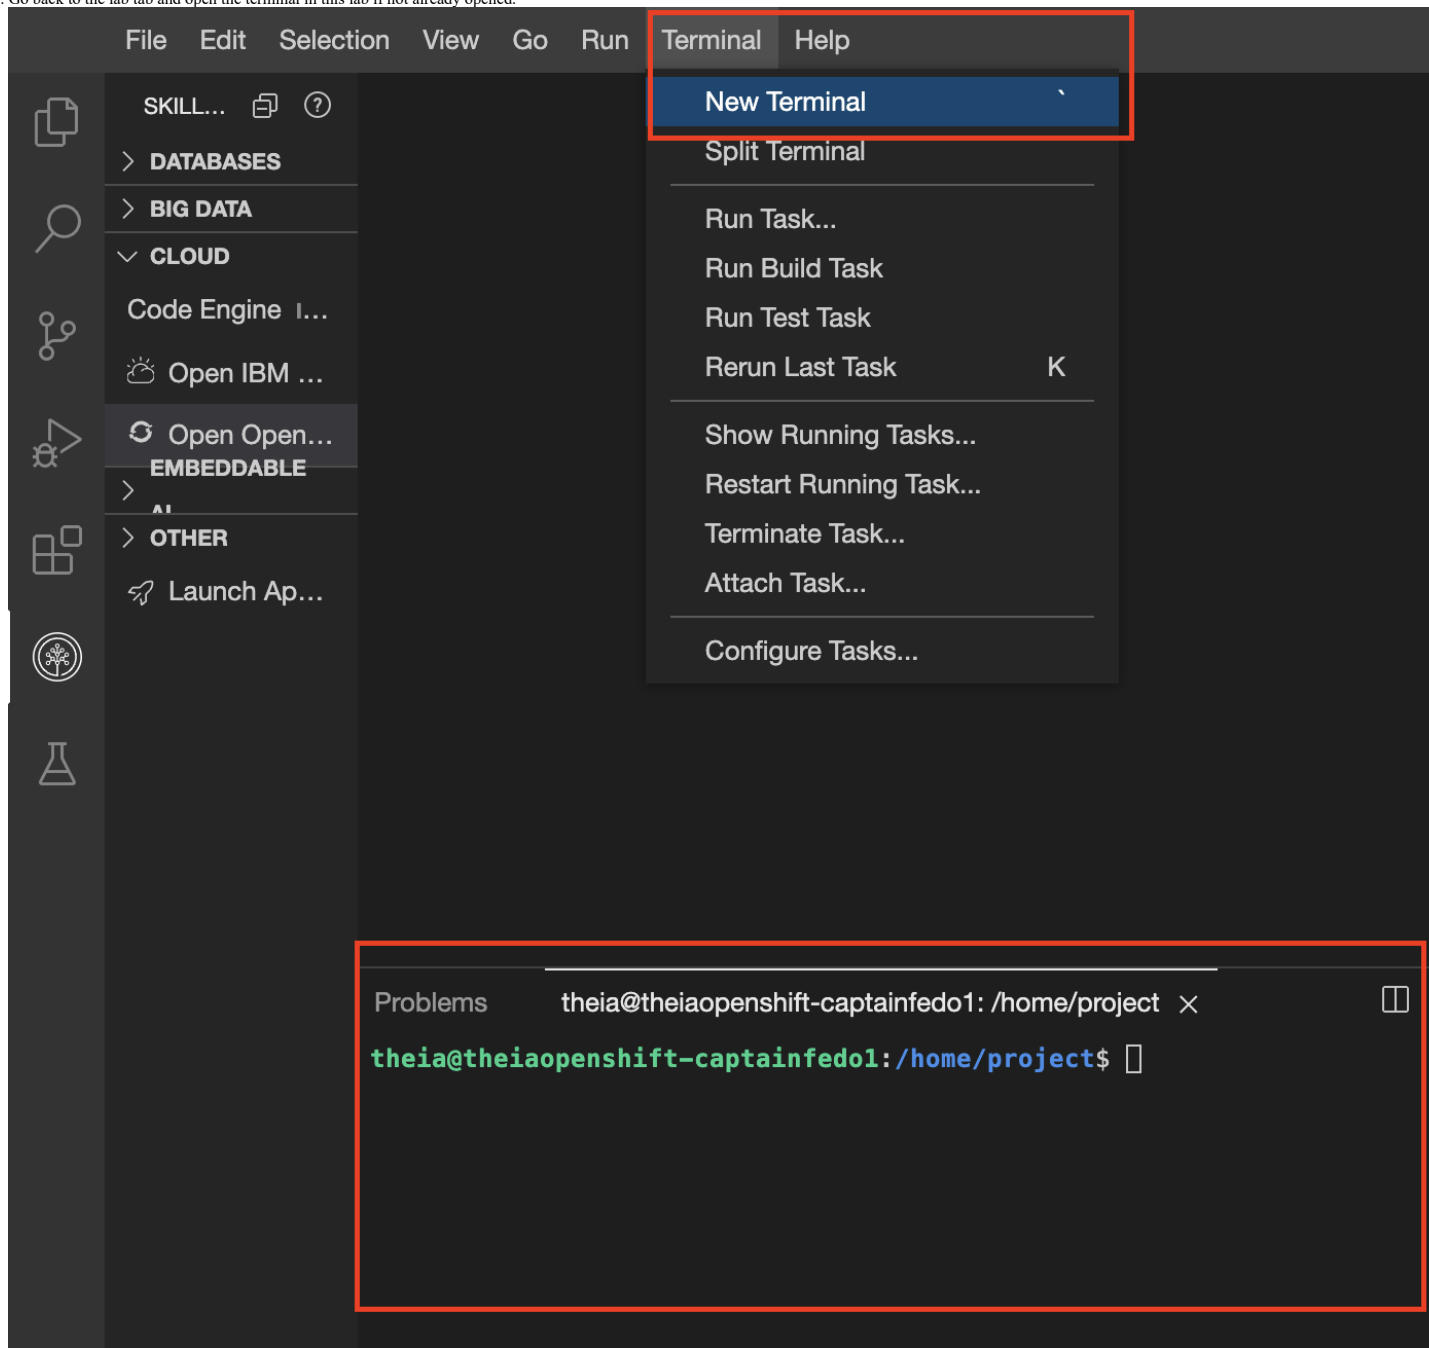

Project

Config Maps

Secrets

opensh...onsole

3. Go back to the lab tab and open the terminal in this lab if not already opened.

4. Run the following command to install MongoDB server in your OpenShift environment.

```
1. 1
1. oc new-app mongo:latest
```

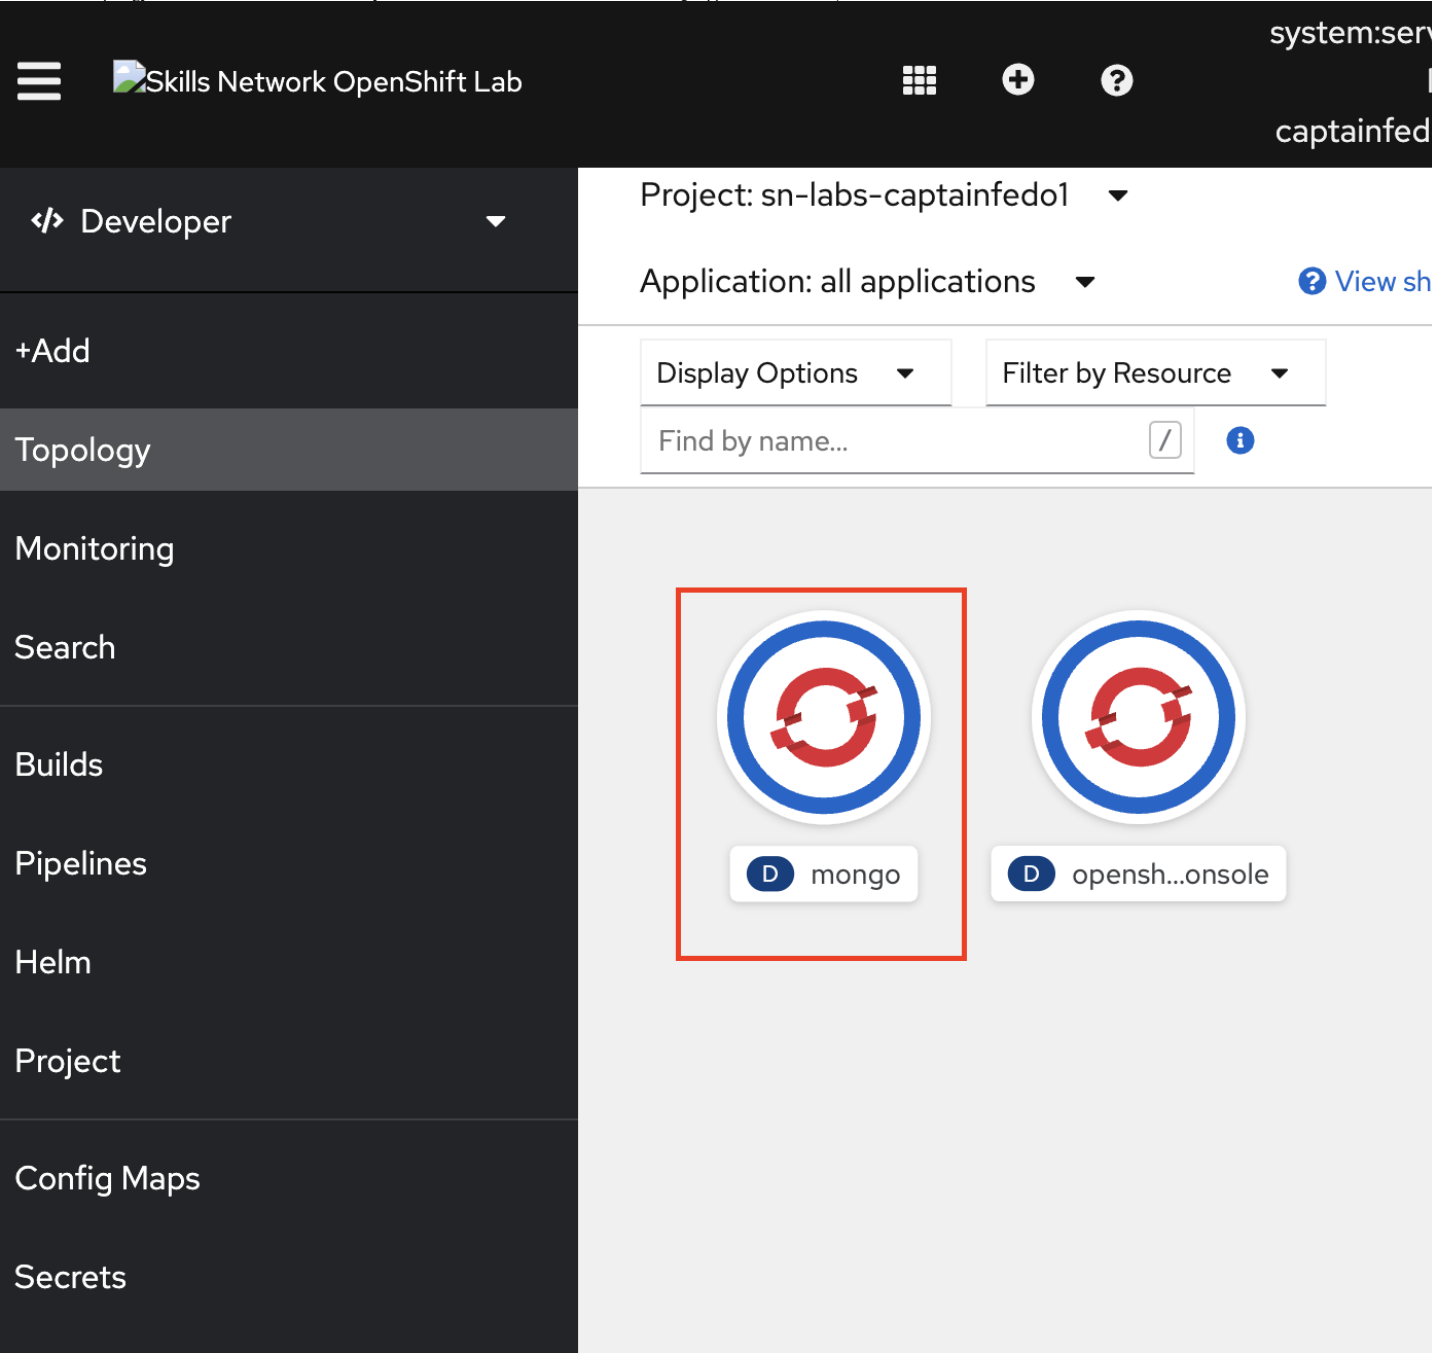

You should see an output as follows:

```
1. 1
2. 2
3. 3
4. 4
5. 5
6. 6
7. 7
8. 8
9. 9
10. 10
11. 11
12. 12
1. --> Found container image a440572 (13 days old) from Docker Hub for "mongo:latest"
2.
3. * An image stream tag will be created as "mongo:latest" that will track this image
4.
5. --> Creating resources ...
6. imagestream.image.openshift.io "mongo" created
7. deployment.apps "mongo" created
8. service "mongo" created
9. --> Success
10. Application is not exposed. You can expose services to the outside world by executing one or more of the commands below:
11. 'oc expose service/mongo'
12. Run 'oc status' to view your app.
```

Take a screenshot of the output and save as deploy-getsong-1.png (or .jpg).

1. Return to the topology browser window or relaunch it if you closed it before. You should now see a mongo application and the openshift-web-console from before.

Take a screenshot of the topology view showing Mongo running as an application and save as `deploy-getsong-2.png` (or .jpg).

Evidence

- 1. Take a screenshot of the `oc new-app mongo` command showing the output from OC CLI. Save it as `deploy-getsong-1.png` (or .jpg).
- 2. Take a screenshot of the topology view showing Mongo running as an application. Save it as `deploy-getsong-2.png` (or .jpg).

Optional Tasks

1. We did not expose the mongo application to the internet. However, you can access this server from within the pod itself. Execute the following command in the terminal to print out the mongo version:

```
1. 1
1. oc get po
Copied! Executed!

You should see an output as follows:

1. 1
2. 2
3. 3
4. 4
5. 5
1. oc get po
2. NAME                                READY    STATUS    RESTARTS   AGE
3. mongo-79cbc7d7b9-5x5p9              1/1      Running   0           18m
4. openshift-web-console-78f49566d7-4bs8m 2/2      Running   0           26m
5. openshift-web-console-78f49566d7-68dkp 2/2      Running   0           26m
Copied!
```

2. Run the following command with the mongo pod. The name assigned to your pod will be different than what is shown here:

```
1. 1
1. oc exec mongo-79cbc7d7b9-5x5p9 -- mongosh --quiet --eval "db.version()"
```

Copied! Executed!

The command should output the version of Mongo installed in your pod. This might be different than what is shown here.

```
1. 1
2. 2
1. oc exec mongo-79cbc7d7b9-5x5p9 -- mongosh --quiet --eval "db.version()"
2. 6.0.4
```

Copied!

Congratulations! You successfully installed the MongoDB server on OpenShift. You are also able to access the server by using the `oc exec` command.

## Exercise 7: Songs - Clone the GitHub Repository

### Your Tasks

You created a new repository for the songs service from the provided template in a previous lab. If not, go back to the [Creating Get Songs Service with Flask](#) lab and ensure you complete it before continuing this lab.

1. Open a terminal with `Terminal -> New Terminal` if one is not open already.
2. Change to the project directory. You do not want to clone the songs service in the pictures service directory.

```
1. 1
1. cd /home/project
```

Copied!

Executed!

3. Next, use the `export GITHUB_ACCOUNT` command to export an environment variable that contains the name of your GitHub account.

**Note:** Substitute your real GitHub account for the `{your_github_account}` placeholder below:

```
1. 1
1. export GITHUB_ACCOUNT={your_github_account}
```

Copied!

4. You can use `echo` the variable in the terminal to double check the value:

```
1. 1
1. echo $GITHUB_ACCOUNT
```

Copied!

Executed!

5. Then use the following commands to clone your repository.

```
1. 1
1. git clone https://github.com/$GITHUB_ACCOUNT/Back-End-Development-Songs.git
```

Copied!

Executed!

6. Change into the `devops-capstone-project` directory, and execute the `./bin/setup.sh` command.

```
1. 1
2. 2
3. 3
1. cd Back-End-Development-Songs
2. bash ./bin/setup.sh
3. exit
```

Copied!

Executed!

7. You should see the follow at the end of the setup execution:

```
*****
Capstone Environment Setup Complete
*****

Use 'exit' to close this terminal and open a new one to initialize the environment

theia@theia-captainfedo1:/home/project$
```

## Exercise 8: Songs - Deploy to OpenShift

Let's install the songs microservice to OpenShift. In order to do so, you will simply point OpenShift to your GitHub repository. If you made any changes to the source code, ensure that is committed and pushed back to the main branch of your GitHub repository. Additionally, you will need to tell the application where to find the Mongo server.

### Your Tasks

1. Applications within the same OpenShift project can refer to other applications with the name `servicename.openshift_project.svc.cluster.local`. The MongoDB Server application is called `mongo`. Run the following command to get the OpenShift project:

```
1. 1
1. oc get project
```

Copied!

Executed!

The result might look as follows:

```
1. 1
2. 2
1. NAME                DISPLAY NAME    STATUS
2. sn-labs-captainfedo1
```

Copied!

The project name is `sn-labs-captainfedo1`. Your project name might look different. The full server path becomes `mongo.sn-labs-captainfedo1.svc.cluster.local`.

2. Export your OpenShift project name as the variable `OPENSHIFT_PROJECT` as follows:

```
1. 1
1. export OPENSHIFT_PROJECT=sn-labs-captainfedo1
```

Copied!

Executed!

Replace the value with your OpenShift project.

3. Push the application to RedHat OpenShift using the following command:

```
1. 1
1. oc new-app https://github.com/${GITHUB_ACCOUNT}/Back-End-Development-Songs --strategy=source --name=songs --env MONGODB_SERVICE=mongo.${OPENSHIFT_PROJECT}.svc.cluster.local --name songs
```

Copied!

- strategy=source: builds directly from source code
- --name: gives the application a name of songs
- --env: sets the internal address for the mongo service

Take a screenshot of output of the oc new-app for the **song microservice**. Save the screenshot as deploy-getsong-3.jpg (or .png).

4. The previous step triggers a build for the application. As mentioned in the output, you can trace the logs for the build using this command:

```
1. 1
1. oc logs -f buildconfig/songs
```

Copied! Executed!

You should see an output as follows:

```
1. 1
2. 2
3. 3
4. 4
5. 5
6. 6
7. 7
8. 8
9. 9
10. 10

Runn

8. You need to expose the application so that you can reach it from outside the lab environment. Go back to tab running the lab IDE and open a new terminal. Use the expose command as follows:

```
1. 1
1. oc expose service/songs
Copied! Executed!

You should see the following output:

1. 1
2. 2
1. $ oc expose service/songs
2. route.route.openshift.io/songs exposed
Copied!
```

Take a screenshot of output of the oc expose svc command. Save the screenshot as deploy-getsong-4.jpg (or .png).

9. Copy the URL of the application from the application flyout. You will need this URL in the next lab to connect the main Django application with the songs microservice.

songs

✓ Build #1 is complete (10 minutes ago)

Services

S

songs

Service port: 8080-tcp → Pod Port: 8080

Routes

RT

songs

Location:  
<http://songs-sn-labs-captainfedo1.labs-prod-openshift-san-a45631dc5778dc6371c67d206ba9ae5c-0000.us-east.containers.appdomain.cloud>

Alternatively, you can use the `oc get route` command in the terminal:

```
1. 1
1. oc get route songs
```

Copied! Executed!

You should see a similar output with the URL listed under the path column:

```
1. 1
2. 2
3. 3
1. $ oc get route songs
2. NAME          HOST/PORT
3. songs        songs-sn-labs-captainfedo1.labs-prod-openshift-san-a45631dc5778dc6371c67d206ba9ae5c-0000.us-east.containers.appdomain.cloud
```

|  | PATH | SERVICES | PORT     | TERMINATION | WILDCARD |
|--|------|----------|----------|-------------|----------|
|  |      | songs    | 8080-tcp |             | None     |

Copied!

10. Use the `curl` command with the URL `curl -X GET $URL/health`. You should get a result as follows:

```
1. 1
2. 2
3. 3
4. 4
1. curl -X GET http://songs-sn-labs-captainfedo1.labs-prod-openshift-san-a45631dc5778dc6371c67d206ba9ae5c-0000.us-east.containers.appdomain.cloud/health
2. {
3.   "status": "OK"
4. }
```

Copied!

Take a screenshot of output of the `curl` command hitting the `/health` endpoint. Save the screenshot as `deploy-getpic-5.jpg` (or `.png`).

Evidence

- 1. Take a screenshot of output of the `oc new-app` for the **song microservice**. Save the screenshot as `deploy-getsong-3.jpg` (or `.png`).
- 2. Take a screenshot of output of the `oc expose svc` command. Save the screenshot as `deploy-getsong-4.jpg` (or `.png`).

3. Take a screenshot of output of the curl command hitting the /health endpoint. Save the screenshot as deploy-getpic-5.jpg (or .png).

If you don't get a result back or run into an error, you can follow these steps again or ask for help in the course forum.

Congratulations! You just deployed the **Songs** microservice on RedHat OpenShift. Ensure you copy the public URLs of both services. You will need it for the final lab of this capstone project.
