

Hands-on Lab: Working with Multiple Tables

Estimated time needed: 30 minutes

In this lab, you will through some SQL practice problems that will provide hands-on experience with SQL queries that access multiple tables. You will be:

- Accessing Multiple Tables with Sub-Queries
- Accessing Multiple Tables with Implicit Joins

How does an Implicit version of CROSS JOIN (also known as Cartesian Join) statement syntax look?

SELECT column_name(s)
FROM table1, table2;

How does an Implicit version of INNER JOIN statement syntax look?

SELECT column_name(s)
FROM table1, table2
WHERE table1.column_name = table2.column_name;

Software Used in this Lab

In this lab, you will use <u>IBM Db2 Database</u>. Db2 is a Relational Database Management System (RDBMS) from IBM, designed to store, analyze and retrieve the data efficiently.

To complete this lab you will utilize a Db2 database service on IBM Cloud. If you did not already complete this lab task earlier in this module, you will not yet have access to Db2 on IBM Cloud, and you will need to follow the lab below first:

• Hands-on Lab: Sign up for IBM Cloud, Create Db2 service instance and Get started with the Db2 console

Database Used in this Lab

The database used in this lab is an internal database. You will be working on a sample HR database. This HR database schema consists of 5 tables called **EMPLOYEES**, **JOB_HISTORY**, **JOBS**, **DEPARTMENTS** and **LOCATIONS**. Each table has a few rows of sample data. The following diagram shows the tables for the HR database:

SAMPLE HR DATABASE TABLES

NOTE: This lab requires you to have all 5 of these tables of the HR database populated with sample data on Db2. If you didn't complete the earlier lab in this module, you won't have the tables above populated with sample data on Db2, so you will need to go through the lab below first:

• Hands-on Lab: Create tables using SQL scripts and Load data into tables

Objectives

After completing this lab you will be able to:

- Write SQL queries that access more than one table
- Compose queries that access multiple tables using a nested statement in the WHERE clause
- Build queries with multiple tables in the FROM clause
- Write Implicit Join queries with join criteria specified in the WHERE clause
- Specify aliases for table names and qualify column names with table aliases

NOTE: Make sure that you are using the CSV file and datasets from the same instruction file.

Instructions

When you approach the exercises in this lab, follow the instructions to run the queries on Db2:

- Go to the <u>Resource List</u> of IBM Cloud by logging in where you can find the Db2 service instance that you created in a previous lab under Services section. Click on the **Db2-xx service**. Next, open the Db2 Console by clicking on **Open Console** button. Click on the 3-bar menu icon in the top left corner and go to the **Run SQL** page. The Run SQL tool enables you to run SQL statements.
 - o If needed, follow Hands-on Lab: Sign up for IBM Cloud, Create Db2 service instance and Get started with the Db2 console

Exercise 1: Accessing Multiple Tables with Sub-Queries

1. Problem:

Retrieve only the EMPLOYEES records that correspond to jobs in the JOBS table.

- ▶ Solution
- ▶ Output
- 2. Problem:

Retrieve only the list of employees whose JOB_TITLE is Jr. Designer.

Retrieve JOB	information and who earn more than \$70,000.
SolutionOutputProblem:	
Retrieve JOB	information and whose birth year is after 1976.
➤ Solution ➤ Output 5. Problem:	
Retrieve JOB	information for female employees whose birth year is after 1976.
▶ Solution▶ Output	
	2: Accessing Multiple Tables with Implicit Joi
. Problem:	2: Accessing Multiple Tables with Implicit Joi
Perform an in Solution Output	
Perform an in Polytion Cutput Problem:	
Perform an in Polytion Output Problem:	mplicit cartesian/cross join between EMPLOYEES and JOBS tables.
Perform an in Perform an in Solution Output Problem: Retrieve only Solution Output Problem:	mplicit cartesian/cross join between EMPLOYEES and JOBS tables.

➤ Solution
➤ Output
3. Problem:

➤ Solution
➤ Output
5. Problem:

Redo the previous query, but specify the fully qualified column names with aliases in the SELECT clause.

- ► Solution
- ► Output

Solution Script

If you would like to run all the solution queries of the SQL problems of this lab with a script, download the script below. Upload the script to the Db2 console and run. Follow <u>Hands-on Lab</u>: <u>Create tables using SQL scripts and Load data into tables</u> on how to upload a script to Db2 console and run it.

• MultipleTables Solution Script.sql

Congratulations! You have completed this lab, and you are ready for the next topic.
